

# Tableau Demonstration Dashboard

Focus of this analysis is to create a tool to assist in selecting new site locations of future store builds

## Data Assets

### Woolworths

- Woolworths National Supermarket Directory
- [https://www.wowlink.com.au/wps/portal/topic\\_centre?WCM\\_GLOBAL\\_CONTEXT=/cmgt/wcm/connect/Content%20Library%20-%20WOWLink/WOWLink/Topic%20Centre/B2B/GLN/WOWSupermarketsDirectory](https://www.wowlink.com.au/wps/portal/topic_centre?WCM_GLOBAL_CONTEXT=/cmgt/wcm/connect/Content%20Library%20-%20WOWLink/WOWLink/Topic%20Centre/B2B/GLN/WOWSupermarketsDirectory)

### G-NAF

- PSMA's G-NAF dataset contains all physical addresses in Australia. It's the most trusted source of geocoded addresses for Australian businesses and governments.

### Australian Bureau of Statistics

- Census data
- Expenditure Survey
- Geographical Boundaries of Statistical areas (MB, SA1, SA2, etc)

### MapBox

- Creating custom background maps for Tableau

# “Hackathon”

## Introduction to the business issue

For this project I came up with a common business need (and one I have tackled in the past)

The solution is built entirely from the ground up and specifically for this project

All data are actuals; Household count, catchment sizes, Geo-demographic profiles, etc

Business Need	Build New Stores
Problem Statement	How to use data and analytics to assist non technical team members make informed decisions.
Specific questions to answer	<ol style="list-style-type: none"><li>1. How much <b>revenue</b> will the store generate?</li><li>2. <b>Rank potential site locations:</b> Where to build first?</li><li>3. <b>Catchment size:</b> How close to current Woolworths' stores should we build? What areas are we currently <u>underserving</u>?</li><li>4. How many <b>potential customers</b> will the store reach</li><li>5. Where are our <b>competitors</b> located</li></ol>
Solution	An interactive Dashboard / visualization that integrates these requirements, simply.

## How much revenue will the store generate?

In its most simple form, we can characterise the main factors that influence revenue as follows:

$$\text{Revenue} = \text{Population} + \text{demographics} - \text{competitors}^*$$

note: competitors can be other Woolworths stores

- **Population:** This can be further broken down into
  - Daytime population: This is the number of people who work within the stores catchment. Lets assume that this **increases sales by \$15 per person**, per week (additional groceries, lunch, snacks, etc.)
  - Households: These are people that live withing the stores catchment area. On average, **each household spends \$270 per week** on groceries\*\*
- **Demographics** assuming that: household composition, education, occupation, age, etc effect a persons income level, then we can summarise the effects from demographics using the following table

	EQUIVALISED DISPOSABLE HOUSEHOLD INCOME QUINTILES					All households
	Lowest	Second	Third	Fourth	Highest	
Food and non-alcoholic beverages	198.84	214.63	258.05	291.75	346.48	270.89

- **Competitors** At a macro level, Woolworths has 33% market share\*

<http://www.roymorgan.com/findings/8336-fresh-food-and-grocery-report-december-2019-202003230634>

## How much revenue will the store generate?

As an example, Assume 1,000 hh in each quintile within the **catchment**. Then,

$$\text{Revenue} = \left\{ \begin{array}{|c|c|c|} \hline \text{Expend.} & & \text{HH's} \\ \hline 198.84 & \times & 1,000 \\ \hline 214.63 & \times & 1,000 \\ \hline 258.05 & \times & 1,000 \\ \hline 291.75 & \times & 1,000 \\ \hline 346.48 & \times & 1,000 \\ \hline \end{array} \right\} + \text{Daytime} \times 15 \left\} \times 0.33$$

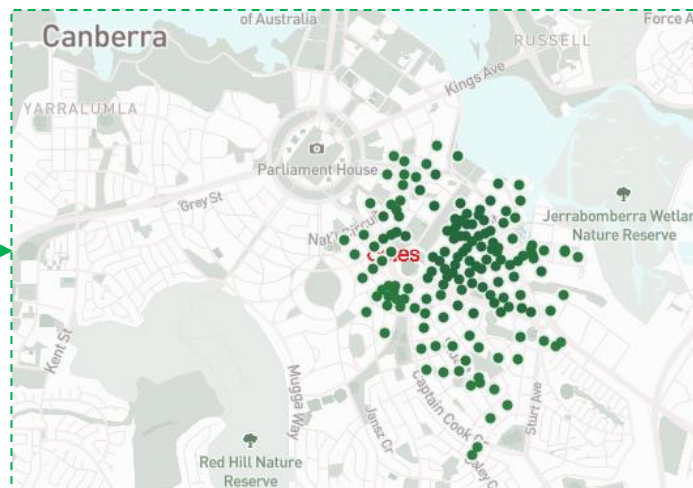

**Note:** In a production version of this dashboard we would be modelling a known revenue number against **all available demographics**, such as Household composition, Age, Education, Occupation, Ethnicity, etc.

## Rank potential site locations:

- There are **4,790 meshblocks** evaluated in this model. These are grouped into percentiles and ranked in descending order. For example,
  - 1 = top 1% of all potential sites, and
  - 100 = top 100% (ie ranked very last)

The dashboard allows the ability to quickly highlight the top potential sites to focus in on.

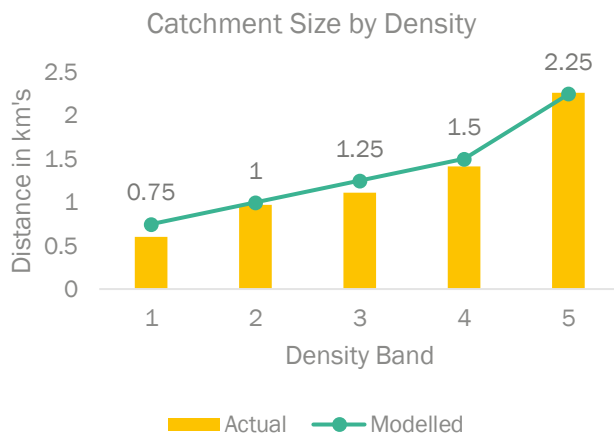

Shown here are the top 10% of sites in Canberra. We can quickly see that the area around Manuka has high potential.

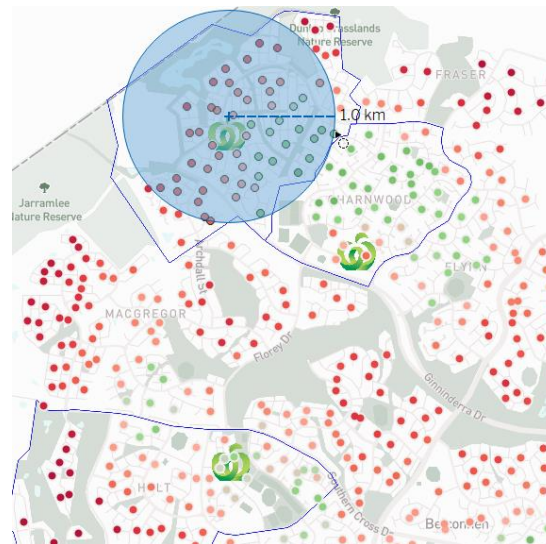

## Catchment size

- An **approximation** to the optimal size of catchments can be made by using the **actual distance between current stores**.
  - A key consideration is that this number will vary depending on the density of an area. Eg smaller in the city and larger in suburban / rural areas.

### ACTUAL

### DASHBOARD

## Geo-demographic variables

Once we know which Meshblocks are contained within each catchment we can then;

- Add in Household counts from G-NAF
- Append ABS data
  - Household Composition
  - Income
  - Grocery Expenditure
  - Destination zones for “Daytime Population”

## Dunlop and Charnwood Stores
